"Behavior of a cloned murine interferon alpha/beta receptor expressed in homospecific or heterospecific background.";

Proc. Natl. Acad. Sci. U.S.A. 89:4774-4778(1992).

1- FUNCTION: RECEPTOR FOR INTERFERONS ALPHA AND BETA. BINDING TO TYPE I I FINS TRIGGERS TYROSINE PHOSPHORYLATION OF A NUMBER OF PROTEINS INCLUDING JAKS, TYK2, STAT PROTEINS AND IFN-R ALPHA-AND BETA-SUBUNITS THEMSELVES.

1- SUBUNITS THEMSELVES.

1- SUBULILAR LOCATION: TYPE I MEMBRANE PROTEIN LIKE DOMAINS.

1- SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.

- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
- SIMILARITY: BELONGS TO THE CLASS II CYTOKINE FAMILY OF RECEPTORS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          õ
                                                                                                                                                                                                                                                                                                                          EPHRIN-A1, -A2, -A3, -A4 AND -A5.

-I- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP + PROTEIN TYROSINE PHOSPHATE.

-I- SUBCELULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-I- ALTERNATIVE PRODUCTS: A NUMBER OF VARIANTS ARE PRODUCED BY ALTERNATIVE SPLICING.

-I- TISSUE SPECIFICITY: ALMOST EXCLUSIVELY EXPRESSED IN THE NERVOUS SYSTEM. PREDOMINANTLY EXPRESSED IN NEURONS.

-I- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.

-I- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

EL SUBMITTED (JUN-1996) to the EMBL/GenBank/DDBJ databases.

1 - FUNCTION: IMPLICATED AS A TUMOR SUPPRESSOR GENE.

2 - - SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN ARE PRODUCED FROM CONTROL PRODUCTS: TWO FORMS OF THE PROTEIN ARE PRODUCED FROM THE SAME GENE BY THE USE OF ALTERNATIVE INITATION SITES. A THIRD COMMENT OF THE SAME GENE BY THE USE OF ALTERNATIVE INITATION SITES. A THIRD COMMENT OF THE SEMBLE ONLY IN THE EMBRYO IS PRODUCED BY ALTERNATIVE SPLICING.

2 FORM WHICH IS EXPRESSED ONLY IN THE EMBRYO AT HIGH LEVELS IN THE EMBRYO. EXPRESSED AT HIGH LEVELS IN THE CONTAIN AND NEURAL TUBE. IN ADULT, HIGHLY EXPRESSED IN COMPLETORY OF LEVELS FOUND IN TESTIS, HEART AND THYMUS.

3 EXPRESSED DURING MID GESTATION. LEVELS DECREASE IN LATE GESTATION EXPRESSED DURING MID GESTATION. LEVELS DECREASE IN LATE GESTATION AND REMAIN AT THIS LEVEL IN THE ADULT.

3 EXPRESSED DURING MID GESTATION. LEVELS DECREASE IN LATE GESTATION AND REMAIN AT THIS LEVEL IN THE ADULT.

3 EXPRESSED DURING MID GESTATION. LEVELS DECREASE IN LATE GESTATION AND REMAIN AT THIS LEVEL IN THE ADULT.

Basu R., Welcher A.A.;

"cDNA cloning and tissue distribution of five human EPH-like receptor
protein-tyrosine kinases.";

Oncogene 10:897-905(1995).

-1- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO
EPHRIN-A1, -A2, -A3, -A4 AND -A5.
-1- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
PROTEIN TYROSINE PHOSPHATE.

MEDLINE; 95206782. TISSUE-BRAIN SEQUENCE OF 25-1037 FROM N.A.

Submitted (JAN-1996) Miescher G.C. TISSUE-BRAIN; SEQUENCE FROM N.A.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             n DB seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pr water soluble polypeptide(s) strongly bind interferon(s) alpha pr and beta - useful as immunosuppressants, for treating auto:immune pr diseases and transplant rejection

PT diseases and transplant rejection

CC Laim 2; Fig 1; 58pp; English.

CC DNA encoding the water-soluble polypeptide with a high affinity for CC IFN-alpha and -beta is isolated by PCR, using appropriate

CC digonucleotides as primers and cloned CDNA as template. For example, CC the IFN-alpha and -beta receptor (030531), was incubated with oligos CC the IFN-alpha and -beta receptor (030533), was incubated with oligos CC lacks the transmembrane and cytoplasmic domains. Both forms bind CC lacks the transmembrane and cytoplasmic domains. Both forms bind CC treating autoimmune diseases and graft rejection. They lack the CC toxic side-effects of known immunosuppressants such as steroids.

                                                                                                                                                                                                                                                                                                                                               New human alpha interferon receptor protein - useful for testing interferon agonists and in treatment or diagnosis Disclosure; fig 4; 30pp; French.

This recombinant human alpha interferon (IFN) receptor protein is useful for the testing of IFN agonists and for treatment and diagnosis of viral diseases and tumours. Antibodies raised against this protein can be used for blocking the receptor when required, eg where overexpression of alpha-IFN is harmful. The Abs are also useful for eg drug targetting. Variants of the protein, between residues 479 and 480, are also useful.

                                                                                                                                                                                                                                                                                                                                                                                              New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, aplastic anaemia, diabetes mellitus, rheumatoli arthritis, etc.
Disclosure; Page 47; 52pp; French.
The invention covers derivatives of the interferon-alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from transformed cells. Soluble deriv.s block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft rejection. See also 014239.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      water soluble polypeptide(s) strongly bind interferon(s) alpha pri and beta - useful as immunosuppressants, for treating auto:immune pri diseases and transplant rejection Claim 3; Fig 2; S8pp; English.

CO DNA encoding the water-soluble polypeptide with a high affinity for DNA encoding the water-soluble polypeptide with a high affinity for CIFN-alpha and -beta is isolated by PCR, using appropriate coligonuclectides as primers and clonned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos C 16 che if Na 19h and -beta receptor (Q30533), was incubated with oligos C 16 che if Na 19h and cytoplasmic domains. Both forms bind C 16 che transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the C toxic side-effects of known immunosuppressants such as steroids.

A recombinant soluble form of the extracellular domain of this receptor (R71723) has been used to raise immunomodulatory monocional antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human IFN receptor.
